
1 After how much duration of inactivity, scheduled refresh will get paused?

- In **Power BI Service**, if a dataset **hasn't been accessed** (i.e., no one has opened or queried the report/dashboard that uses it) for **more than 2 months (60 days)**, then **the scheduled refresh for that dataset is automatically paused**.
- When this happens, Power BI shows a **warning message** in the dataset settings like:

“This dataset’s scheduled refresh has been paused due to inactivity.”

- Once someone **opens or interacts** with the report or dashboard again, the scheduled refresh will **automatically resume** (you can also manually re-enable it).

2 For which licensed user is Dataflow creation possible?

- **Dataflows** can be created only by users who have one of the following licenses:
 - ✓ **Power BI Pro** license
 - ✓ **Power BI Premium Per User (PPU)** license
 - ✓ Users working in a **workspace backed by Premium capacity**

 Summary Table

Feature	Requirement / Condition
Scheduled Refresh Pause	After 60 days of inactivity
Resume Refresh	Automatically resumes when report/dataset is accessed
Dataflow Creation License	Power BI Pro, PPU, or Premium capacity workspace

✓ **In short:**

- Scheduled refresh pauses after **60 days** of no use.
- **Dataflows** can be created by **Pro or Premium users** (not by free users).
